Winter 2013
Team CITO Version Control Policy
Ryan Doubleday, Justina Hubbard, Mithun Reddy, Mark Deryavoush
Haiti EMR

This document describes the policies set in place by CITO in order to dictate how version control will be used in the project Haiti EMR. All members of CITO are held accountable for their part and their actions.

As for the repository each member once a week preferably by T**uesday** will push a new local branch to to a remote git repository so that the group can see the progress being made but not ready to be put in the master branch. In this way if a member wants to access the change and test it, they can update their local repository with all of the changes on the GitHub repository and create a local branch.

A push will be made to the Master Branch once all local branches have been tested and the group has come to a consensus that a push can be made.

Directories have been added to the repository for documentation, administrative policies, and source codes. All directories have a readme file that explains all files included in the directory. When a member adds a file to the directory, they are to also add the information into the readme file.
